nouvelle collection de lunettes OKIA en fibre de carbone

OKIA: FOR THE FIRST TIME HDA® TECHNOLOGY MEETS CARBON FIBER

OKIA never stops surprising its clients and customers through the continuous development and improvement of its patented HDA® Technology. "Play with Carbon Fiber" is the latest collection launched by the Hong-Kong based eyewear company, and it represents something truly revolutionary: **for the first time carbon fiber is mixed with HDA® Technology**, with the result of a collection that is a masterpiece of ultimate technology.

Invented in Japan in 1961, carbon fiber is a material made of nylon and carbon used in many different fields - aerospace, civil engineering and motor sports - and in products like sports' gear and aircrafts. Talking about eyewear, **it provides the endurance of metal frames but is thin and lightweight like plastic**. It also has a vaguely **three-dimensional look** that make patterns and textures extremely attractive.

"Play with Carbon Fiber" combines the unrivaled physical properties of carbon fiber with the **incredible potential of HDA® Technology**: geometric patterns and brilliant colours - such as metallic grey and neon yellow - that reflect a funny and trendy sporty style. Moreover, each frame exhibits a different surface finishing to satisfy each customer's taste.

Intriguing and functional at the same time, "Play with Carbon Fiber" is conceived for both men and women, offering a perfect blend of high technology, design and fashion.
