

OKIA's HD Patent again has proven itself as an innovative and pioneering technology

September, 2010. OKIA Optical Company Limited's (OKIA) patented HD (High Definition) Technology again has proven itself as an **innovative** and **pioneering** invention. On July 2nd, 2010, the State Intellectual Properties Office of People Republic of China has announced the final ruling **in favor of OKIA** on the re-examination of OKIA HD patent invalidation requested by a Hong Kong Acetate Manufacturer in China.

The ruling has confirmed that OKIA's HD technology patents are valid. **OKIA's HD technology is unique and specialized**, which the technology allows eyewear designers and brand managers to create any innovative HD (High Definition) colors and patterns. The **Clarity of color** and pattern is so vivid, which make it almost life-like. What's more? OKIA's patented HD technology does not require **MOQ** (Minimum Order Quantity) which is no risk to the customer trying out any new color. These advantages open up a totally new level of creativity and possibility on products and colors development!

Besides the ability of creativeness, the key benefit of using OKIA's HD technology is the protection against potential copy-cats or infringement. OKIA stands firmly in protecting their customers and the **intellectual properties** of every OKIA product. If the copied products are claiming themselves to be also HD (High Definition), it may be misleading and harming the trust of their customers. OKIA is proactively taking necessary actions to stop suspected 'copy-cats' and infringed products to the market.
