

OKIA Takes You To Outer Space With 'Glitter Stars' Eyewear Collection

The new eyewear collection combines different acetate layers and metallic colours to create the effect of a sky filled with stars

Galaxy prints are a hot new fashion trend. From nails and make-up colours to prints found in clothing, stylists and designers would like to create real 'down to Mars' girls.

The new 'Glitter Stars' collection launched by OKIA meets this increasing interest towards outer planets and the universe through interesting HDA[®] patterns that evoke a sparkling galaxy. Combining different acetate layers and metallic colours with controlled geometry or random motifs, 'Glitter Stars' frames create the sensational effect of a sky full of shining stars. Thanks to CSB (Crazy Sparkling Beauty) technique, precious glitter decorations meet the acetate patterns producing a brilliant 3D outcome.

From the 'Glitter Stars' Collection

'Glitter Stars' represents another success reached by OKIA through the application of the HDA[®] Technology. This well-known patented technology allows infinite possibilities in terms of creativity and design, translating every kind of inspirational pattern on acetate sheets. Thanks to HDA[®] Technology, unconventional galactic patterns are shown on acetate to make one's look truly unique.
